Newly Reported Hepatitis C Based on NYC Neighborhoods
Newly Reported Chronic Hepatitis C (HCV) in The Bronx, 2018

The Bronx:
- Highest rate (74.7)* of newly reported chronic HCV
- Had 1,046 new cases (22.3%) across NYC in 2018

Hunts Point (BX27) neighborhood tabulation area (NTA):
- Rate: 146.7 newly reported cases per 100,000 people (NYC rate: 56.9)

*includes people in Rikers Island facilities

Source: NYC Health Department (2019)
Learning Objectives

By the end of this presentation, participants should be able to describe:

1. The epidemiology of hepatitis C (HCV) in the United States and in New York City (NYC)
2. CDC screening recommendations for HCV and the New York State (NYS) testing law
3. Key steps in pre-therapy assessment
4. Candidates for HCV treatment with direct acting antiviral therapy
5. Patients that require monitoring after treatment
1. Epidemiology, Screening and Diagnosis
2. Pre-Therapy Assessment
3. Treatment of HCV with Direct Acting Antivirals
4. Drug-Drug Interactions
5. Special Populations
6. Access to Direct Acting Antivirals
7. Resources
Epidemiology, Screening and Diagnosis
Introduction to HCV

- Estimated 2.4 million infected in the USA
- Estimated 116,000 infected in NYC
  - 40% undiagnosed
- Leading indication for liver transplantation
- Leading predisposing factor to development of hepatocellular carcinoma (HCC)

HCV is Underdiagnosed in the US

Prevalence = 2.4 million individuals

52% aware

37% receive treatment

Large reservoir of infected patients undiagnosed

HCV Incidence in the United States

Estimated total new HCV infections

www.hepatitis.c.uw.edu/go/screening-diagnosis/epidemiology-us/core-concept/all.
As derived from CDC data, 2017. Ryerson AB et al. MMWR 2020;69:399.
HCV Incidence in the United States

As derived from CDC data, 2017. Ryerson AB et al. MMWR 2020;69:399.
The Opioid Epidemic in the United States

- 10.3 million Americans misuse prescription opioids each year
- 2.0 million Americans have an opioid use disorder
- 808,000 Americans use heroin each year
- 81,000 new heroin users each year
- 32,656 deaths from synthetic opioids each year
- 15,349 deaths from heroin each year

About 40 percent of opioid users are infected with HCV

Rising Incidence of HCV in Youth in the U.S.

Rising Incidence of HCV in Youth: Newly Reported Cases by Age in NYS, 2005 and 2015

Reported cases of hepatitis C infection in New York State (exclusive of NYC)

Number of Newly Reported HCV Cases in NYC By Age, 2018

Source: NYC Health Department (2019)
HCV Care Cascade in NYC, 2018

Care cascade for people in NYC with chronic hepatitis C recently reported (from July 1, 2014 to June 30, 2018) with a positive hepatitis C test, regardless of year of first report.

Source: NYC Health Department (2019)
Transmission of HCV

• Sharing supplies for injection or intranasal drug use
• Transfusion of blood/blood products prior to 1992
• Needle stick injury in health care
• Sharing personal care items (straight razors)
• Being born to a mother who has HCV
• Tattoos, body piercing in unlicensed setting
• Sex with an infected person (blood exposure)
### HCV Risk Factors For People Newly Reported With Chronic HCV in NYC (2019)

Source: [NYC Health Department (2019)](https://www1.nyc.gov/site/doh/health/topics/hcv.page)
Natural History of HCV

- **Acute Infection***
- **Chronic Infection** 75%-85%
- **Cirrhosis** 10%-20% over 20 years
- **Decompensated Cirrhosis** 5-yr survival rate 50%

**HCC** 1%-4% per year

Asymptomatic Extrahepatic manifestations

*Most have minimal symptoms

Most Americans infected >35y
Additional impact of:
- Alcohol
- Obesity
- Older age
Extrahepatic Manifestations of HCV

Strongly associated
- Mixed cryoglobulinemia
- Sjögren (sicca) syndrome
- Lymphoproliferative disorders
- Porphyria cutanea tarda
- Neuropathy
- Membranoproliferative glomerulonephritis
- Cryoglobulinemic vasculitis

Possibly associated
- Corneal ulcers (Mooren ulcers)
- Thyroid disease
- Lichen planus
- Pulmonary fibrosis
- Type 2 diabetes
- Systemic vasculitis (polyarteritis nodosa, microscopic polyangiitis)
- Arthralgias, myalgias, inflammatory polyarthritis
- Autoimmune thrombocytopenia

2020 CDC Recommendations HCV Screening Among Adults in the US

1. **Universal Screening**
   Screen at least once in a lifetime for **all adults ≥18 years** (except in settings where HCV RNA-positivity is <0.1%)

2. **Pregnancy**
   Screening **all pregnant women during each pregnancy** (except in settings where HCV RNA-positivity is <0.1%)

3. **Exposure**
   One-time testing among people with recognized conditions or exposures (more info on [https://www.cdc.gov/hepatitis/hcv/guidelinesc.htm](https://www.cdc.gov/hepatitis/hcv/guidelinesc.htm)), regardless of age or setting prevalence

4. **Periodic testing**
   Routine periodic testing for people with on-going risk factors
Hepatitis C Virus Testing (Chapter 425 of the Laws of 2013)

This law requires a hepatitis C virus screening test to be offered to all patients born between 1945 and 1965 who are receiving health services as a hospital inpatient or receiving primary care services and applies to physician, physician assistant, or nurse practitioner.

The law further requires that the health care provider refer a patient who receives a positive screening test to another provider to receive confirmatory testing and follow-up care.
How Do You Diagnose HCV?

1. **Hepatitis C Antibody (HCV Ab)**
   - Negative (-)
     - STOP here if no concern for acute infection or severe immunosuppression. If so, check HCV RNA.
   - Positive (+)
     - **Check HCV RNA (viral load)**
       - Negative (-)
         - These people are NOT chronically infected.
           - Detectable HCV Ab with negative HCV RNA can occur with spontaneous clearance of infection (about 25% of people exposed to HCV will clear; verify HCV RNA negative in 4 to 6 months) or with treatment of HCV.
       - Positive (+)
         - **Hepatitis C infection**
1. **Evaluation and referral**

---

1. **ICD-10 codes for HCV antibody testing:**
   - *z11.5: Screening for other viral disease*
   - *R74.0: Nonspecific elevation of levels of transaminase and lactic acid dehydrogenase*
<table>
<thead>
<tr>
<th>Medical Provider Responsibilities</th>
<th>Diagnosing and Confirming HCV</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Screen all adults 18-79 years, including pregnant women</strong></td>
<td>In March 2020, USPSTF expanded its recommendation for one-time HCV screening to include all asymptomatic adults ages 18-79 years, including pregnant women: <a href="https://jamanetwork.com/journals/jama/fullarticle/2762186">https://jamanetwork.com/journals/jama/fullarticle/2762186</a></td>
</tr>
<tr>
<td><strong>Use HCV antibody with reflex to RNA testing</strong></td>
<td>Since 2017, NYC Health Code requires labs to automatically perform HCV RNA confirmatory test on all positive antibody test for HCV. Since 2015, NYS Department of Health recommends reflex testing and provides resources for implementation: <a href="https://www.health.ny.gov/diseases/communicable/hepatitis/hepatitis_c/providers/reflex_testing.htm">https://www.health.ny.gov/diseases/communicable/hepatitis/hepatitis_c/providers/reflex_testing.htm</a></td>
</tr>

</table>
Recommendations For HCV Screening In Persons Less Than 18 Years Of Age

- One-time testing should be performed for all persons less than 18 years of age with behaviors, exposures or risk factors or circumstances associated with an increased risk of HCV exposure

Re-testing for Patients at Risk for HCV

- Periodic repeat HCV testing should be offered to all persons with behavioral, exposures or risk factors associated with HCV
- Annual HCV testing is recommended for all persons who inject drugs and for HIV-infected men who have unprotected sex with men

Pre-Therapy Assessment
**Simplified Algorithm for Management of HCV Infection**

1. **Screening and diagnosis**
   - Universal screening optimal or Risk factors/age screening
   - HCV antibody test with reflex to PCR
   - Positive (+) PCR
     - Active HCV infection

2. **Pretreatment assessment and testing**
   - **Initial assessment**: physical exam, stigmata of cirrhosis, clinical and prior treatment history, extrahepatic manifestations
   - **Blood tests**
     - CBC, AST, ALT, bilirubin, albumin, creatinine; HBV, HIV, HAV; eGFR
   - Platelets >150x10^9/L
     - Platelets <150 refer to specialist

3. **Treatment and monitoring**
   - Assess for potential DDI
   - Treatment with pan-genotypic therapy: GLE/PIB or SOF/VEL
   - **Assessment of cure (SVR12)**
     - HCV RNA, ALT
   - Negative (-)
     - HCV RNA
     - Cured
     - Refer to post-cure management

Dieterich et al, Gastroenterology & Hepatology; volume 15, issue 5, supplement 3, May 2019
# Acute HCV: Interpretation of Tests

<table>
<thead>
<tr>
<th>Test</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td>HCV Ab</td>
<td>• Test may be negative during first 6 weeks after exposure</td>
</tr>
<tr>
<td></td>
<td>• Seroconversion may be delayed or absent in immunosuppressed individuals</td>
</tr>
<tr>
<td></td>
<td>• Presence of HCV Ab alone does not distinguish between acute and chronic</td>
</tr>
<tr>
<td></td>
<td>infection</td>
</tr>
<tr>
<td>HCV RNA</td>
<td>• Viral fluctuations $&gt; 1 \log_{10}$ IU/ml may indicate acute HCV infection</td>
</tr>
<tr>
<td></td>
<td>• HCV RNA may be transiently negative during acute HCV infection</td>
</tr>
<tr>
<td></td>
<td>• Presence of HCV RNA alone does not distinguish between acute and chronic</td>
</tr>
<tr>

<td>infection</td>
</tr>
<tr>
<td>ALT</td>
<td>• Fluctuating ALT peaks suggests acute infection</td>
</tr>
<tr>
<td></td>
<td>• ALT may be normal during acute HCV infection</td>
</tr>
<tr>
<td></td>
<td>• ALT may be elevated due to other liver insults, such as ETOH use</td>
</tr>
</tbody>
</table>

[www.hcvguidelines.org](http://www.hcvguidelines.org) Accessed August 10, 2018
HCV Provider Responsibilities

Obtain Basic Blood Tests

- CBC, platelets
- Comprehensive metabolic profile
  - Renal function
  - Liver chemistries
    - Albumin
    - Total bilirubin
    - Alkaline phosphatase
    - Aspartate aminotransferase
    - Alanine aminotransferase
- INR

- Viral studies
  - HIV Ab
  - HAV Ab (total, not IgM!)
  - HBcAb (total, not IgM!)
  - HBsAg
  - HBsAb (quantitative)
HCV Provider Responsibilities
Evaluate for Coexisting Liver Disease

History
- Heart disease
- Diabetes, obesity → NAFLD
- Alcohol abuse → alcoholic liver disease
- Family history of autoimmunity
  - Autoimmune hepatitis
  - Primary biliary cholangitis
  - Primary sclerosing cholangitis
- Family history of liver disease
  - Hereditary hemochromatosis
  - Alpha-1 antitrypsin deficiency

Labs
- Antinuclear antibody (ANA)
- Antismooth muscle antibody (ASMA)
- Anti mitochondrial Ab (AMA)
- Fe / TIBC / Ferritin
- [Ceruloplasmin]
- [Alpha-1 antitrypsin level & phenotype]
- Alpha fetoprotein

Imaging
- Ultrasound
Pre-Therapy Assessment:
Drug-Drug Interactions

- **Very important element in pre-therapy assessment**
- List of prohibited drugs is relatively short
  - Varies depending on regimen chosen
- List of “potential interaction” drugs is longer
- Be alert for interactions with common drugs
  - Statins, proton pump inhibitors, birth control, amiodarone, digoxin
- No herbs! In particular, no St. John’s Wort
- Use online tools to help assess DDI’s

Patients rarely tell you all the pills they are taking!
Assess for Potential Drug-Drug Interactions

<table>
<thead>
<tr>
<th>Key DDI</th>
<th>SOF/VEL</th>
<th>GLE/PIB</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>anticonvulsants, rifampicin, efavirenz, St. John’s wort</td>
<td>amiodarone</td>
</tr>
<tr>
<td></td>
<td>▪ amiodarone</td>
<td>▪ dabigatran</td>
</tr>
<tr>
<td></td>
<td>▪ proton pump inhibitors</td>
<td>▪ ethinyl estradiol-containing contraceptives</td>
</tr>
<tr>
<td></td>
<td>▪ statins</td>
<td>▪ atazanavir</td>
</tr>
<tr>
<td></td>
<td></td>
<td>▪ darunavir</td>
</tr>
<tr>
<td></td>
<td></td>
<td>▪ ritonavir</td>
</tr>
<tr>
<td></td>
<td></td>
<td>▪ statins</td>
</tr>
<tr>
<td></td>
<td></td>
<td>▪ cyclosporine</td>
</tr>
<tr>
<td>Common drugs without interactions</td>
<td>ARBs, methadone, buprenorphine, calcium channel blockers, lamotrigine, omeprazole, progestin-only contraceptives</td>
<td></td>
</tr>
</tbody>
</table>

HCPs should consult prescribing information, their local pharmacist and/or online tools (eg, HEP Drug Interactions; [http://www.hep-druginteractions.org](http://www.hep-druginteractions.org)) to confirm interaction or lack of interaction for specific drugs within a class, as exceptions may exist.

Dieterich et al, Gastroenterology & Hepatology; volume 15, issue 5, supplement 3, May 2019
HIV/HCV Co-infection: Drug-Drug Interactions

• Need to assess carefully:
  o [www.hcvguidelines.org](http://www.hcvguidelines.org)
  o [www.aidsinfo.nih.gov](http://www.aidsinfo.nih.gov)
  o [www.hep-druginteractions.org](http://www.hep-druginteractions.org)

• If antiretroviral switch needed, should be done in collaboration with HIV practitioner
Importance of Assessing Fibrosis

- Patients with bridging fibrosis (stage 3 fibrosis) or cirrhosis (stage 4 Fibrosis) need additional screening:
  - Esophageal Varices
  - Hepatocellular carcinoma

- Allows for selection of proper treatment plan and duration of therapy
  - Protease inhibitors should NOT be used in patients with Child Class B or C cirrhosis.
# Methods for Staging Fibrosis

<table>
<thead>
<tr>
<th>Method</th>
<th>Procedure</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indirect serum</td>
<td>APRI, FIB-4*</td>

*See Hepatitis C online for the following: [APRI Calculator](#) and [FIB-4 Calculator](#)
Non-invasive Formulae to Assess Fibrosis

\[ \text{APRI} = \frac{\text{AST Level (U/L)}}{\text{AST (Upper Limit of Normal) (U/L)}} \times 100 \]

\[ \text{FIB-4} = \frac{\text{Age (years)} \times \text{AST Level (U/L)}}{\text{Platelet Count (10^9/L)}} \times \sqrt{\frac{\text{ALT (U/L)}}{} \times \text{Platelet Count (10^9/L)}} \]
Non-invasive Formulae to Assess Fibrosis

**Aspartate aminotransferase-to-platelet ratio index (APRI)**

- $< 0.5\%$: Low risk of advanced fibrosis (F3-F4)
- Between 0.5 and 1.5: Intermediate risk of advanced fibrosis
- $> 1.5\%$: High risk of advanced fibrosis

**Fibrosis-4 Index (FIB-4)**

- $< 1.45$: Low risk of advanced fibrosis (F3-F4)
- Between 1.45 and 3.25: Intermediate risk of advanced fibrosis
- $> 3.25$: High risk of advanced fibrosis
Treatment of HCV with Direct Acting Antivirals
Goals of Treatment for HCV

• Goal is sustained viral response (SVR) = cure
  – Undetectable virus at least 12 weeks after cessation of anti-viral therapy

• Treatment selection generally dictated by genotype but pangenotypic options are now available

• HCV SVR rates = HCV/HIV SVR rates
SVR (Cure) Associated with Decreased All-Cause Mortality

530 patients with advanced fibrosis, treated with interferon-based therapy, and followed for 8.4 (IQR 6.4-1.4) years

The New World of HCV Therapy

- Interferon-free therapy is here
  - Direct acting antivirals (DAAs) treatment are the standard of care
- Cure is an almost certain outcome

Patient assessment prior to therapy is important
All patients with chronic HCV infection, regardless of fibrosis stage, are considered candidates for antiviral therapy.

HCVGuidelines.org
http://www.hivguidelines.org/hcv-infection/treatment-with-daa/#tab_0.
**High SVR Rates Achieved Across Patient Types**

Test for HBV Before Initiating HCV DAA Therapy

ESAL: Patients commencing DAA-based treatment for hepatitis C should be tested for HBs antigen, anti-HBc antibodies and anti-HBs antibodies (B1)

AASLD: All patients initiating HCV DAA therapy should be assessed for HBV coinfection with HBsAg, anti-HBs, and anti-HBc (B1)

<table>
<thead>
<tr>

</table>
Monitoring During DAA Therapy: Hepatitis B Reactivation Risk

- In patients who are hepatitis B virus (HBV) surface antigen (HBsAg) positive and have no detectable HBV DNA:
  - **Monitor for HBV reactivation** by performing aspartate aminotransferase (AST), ALT, and HBV DNA tests every 4 weeks during HCV treatment.

- In patients who are HBsAg positive and detectable HBV DNA:
  - Monitor or treat as clinically indicated

- Clinicians new to HCV treatment should consult an experienced HCV care provider for further evaluation of patients who develop detectable HBV DNA.

http://www.hivguidelines.org/hcv-infection/treatment-with-daa/#tab_0
If a woman becomes pregnant during therapy with any DAA regimen…

the clinician should discuss with her the benefits and risks of using DAAs during pregnancy.
Special Considerations
Consult With An Expert

- Treatment of decompensated cirrhosis
- Treatment of renal disease
- HIV/HCV coinfection
- Active alcohol / drug use
- Monitoring for hepatocellular carcinoma after SVR in patients with bridging fibrosis or cirrhosis
HIV/HCV Co-infection Treatment

• HIV/HCV co-infected persons should be treated the same as persons without HIV infection
• Treatment courses
  – 12 weeks of pangenotypic therapy
    • Gelcaprevir/Pibrentasvir (GLE/PIB)
    • Sofosbuvir/Velpatasvir (SOF/VEL)
Substance Use and HCV Treatment

- Do NOT withhold HCV treatment solely due to current drug/alcohol use
- Offer suboxone
- Refer to methadone clinics
- Write a prescription for syringes
  - Refer to syringe exchanges (for new cookers, cotton, etc)
- Provide naloxone kit or prescription for naloxone
- Assess for alcohol use and encourage cessation/reduction
- Discuss harm reduction and reinfection
- Treat sexual or drug-using partner together
HCV and Hepatocellular Carcinoma (HCC)

• SVR decreases risk of HCC development but does not eliminate risk

• All HCV patients with bridging fibrosis and cirrhosis need HCC screening, even after SVR

• Recommended HCC screening:
  – Hepatic imaging every 6 months
  – AFP
Removal of HCV Medication Prior Authorization

- As of July 23rd the NYS Medicaid Drug Utilization Review Board (DURB) unanimously voted to recommend removal of prior authorizations for patients awaiting their first HCV DAA treatment for NYS Medicaid Managed Care plans.

Contact Empire Liver Foundation if interested in learning more on how to advocate for removal of Prior Authorizations for Medicare & commercial insurance plans.
Summary

• HCV is curable with readily available combination therapies
• Elimination will require a multifactorial approach to diagnose, link to care, treat and cure HCV
  – To eliminate HCV, we need to broaden our treater base
• The Simplified Algorithm provides a roadmap for non-specialists to treat
• Costs of treatments have come down drastically
• Risk of HCC in cured patients with cirrhosis is decreased but patients still need to be screened for life
• The biggest issue now is getting people tested and treated
• Patients with advanced disease should be referred to a liver specialist
